## Introduction

The IPv6 forum plays a major role to bring together industrial actors, to develop and deploy the new generation of IP protocols. Contrary to IPv4, which started with a small closed group of implementers, the universality of IPv6 leads to a huge number of implementations. Interoperability has always been considered as a critical feature in the Internet community. Due to the large number of IPv6 implementations, it is important to provide the market a strong signal proving the level of interoperability across various products.

To avoid confusion in the mind of customers, a globally unique logo programme should be defined. The IPv6 logo will give confidence to users that IPv6 is currently operational. It will also be a clear indication that the technology will still be used in the future. To summarize, this logo programme will contribute to the feeling that IPv6 is available and ready to be used.

The IPv6 Logo Programme consists in three phases

Phase 1 :

In a first stage, the Logo will indicate that the product includes IPv6 mandatory core protocols and can interoperate with other IPv6 implementations.

Phase 2 :

The "IPv6 ready" step implies a proper care, technical consensus and clear technical references. The IPv6 ready logo will indicate that a product has successfully satisfied strong requirements stated by the IPv6 Logo Committee (v6LC).

To avoid confusion, the logo "IPv6 Ready" will be generic. The v6LC will define the test profiles with associated requirements for specific functionalities.

Phase 3 :

Same as Phase 2 with IPsec mandated.

# 1 Overview

This document organization tests by group based on related test methodology or goals. Each group begins with a brief set of comments pertaining to all tests within that group. This is followed by a series of description blocks; each block a single test. The format of the description block is as follows:

## Description block

<b>[PURPOSE]</b>	The <b>PURPOSE</b> is the short statement describing what the test attempts to achieve. It is usually phrased as a simple assertion of the future or capability to be tested.
<b>[CATEGORY]</b>	The <b>CATEGORY</b> shows you who need to satisfy the test shortly.
<b>[REQUIREMENT OF TEST]</b>	The <b>REQUIREMENT</b> describes the condition of the NUT.
<b>[TOPOLOGY]</b>	The <b>TOPOLOGY</b> describes the network used in the test.
<b>[TEST SETUP]</b>	The <b>TEST SETUP</b> describes how to initialize and configure the NUT before starting each test. If a value is not provided, then the protocol's default value is used.
<b>[INITIALIZATION]</b>	The <b>INITIALIZATION</b> describes step-by-step instructions for carrying out the setting before the test.
<b>[PROCEDURE]</b>	The <b>PROCEDURE</b> describes step-by-step instructions for carrying out the test.
<b>[JUDGMENT]</b>	The <b>JUDGEMENT</b> describes expected result. If we can observe as same result as the description of Judgment, the NUT passes the test.
<b>[REFERENCES]</b>	The <b>REFERENCE</b> section contains some parts of specification related to the tests. It also shows the document names and section numbers.

## Reference to Common

Refer to a common part for some blocks because there are only several kinds of content.

## Reference to Common packets

The reference to Common packets in [INITIALIZATION] and [PROCEDURE] is described.

- Refer to the packet simply.  
Example)  
5. Send Binding Update. (Refer to X.X.X)
- The packet is referred to, and amplification is described.  
Example)  
5. Send Binding Update(Sequence No=10000). (Refer to X.X.X)  
6. Receive Binding Acknowledgement. (HA0 -> NUTX) (Refer to X.X.X)  
# The Lifetime field is less than or equal to 60 seconds.
- Especially, the packet of the focus supplements the field to which it pays attention with the table form.  
Example)

5. Send Binding Update. (Refer to X.X.X)
